

Title: Climate Change and Human Health

1. Causes of Climate Change

- Greenhouse gas emissions from burning fossil fuels.
- Deforestation reducing carbon absorption.
- Industrial pollution and urbanization.
- Agriculture practices releasing methane.

2. Impacts on Human Health

- Increased heatwaves leading to heatstroke and dehydration.
- Spread of vector-borne diseases like malaria and dengue.
- Poor air quality causing asthma and respiratory illnesses.
- Water scarcity and food insecurity.

3. Mitigation Strategies

- Transitioning to renewable energy (solar, wind, hydro).
- Reforestation and sustainable agriculture.
- Public health awareness campaigns.
- International cooperation and climate policy agreements.

4. Adaptation for Health

- Strengthening healthcare systems to deal with climate-driven diseases.
- Developing early warning systems for extreme weather.
- Improving access to clean water and nutritious food.
- Community-based adaptation projects.
